

AI Tools

When using AI to design UI, we can find various tools that we can implement to make this task easier for us. Considering the advances that AI has had in recent years, we have tools like Uizard, which has the ability to take sketches as the basis for developing projects, as well as the ability to generate code from the sketch.

In some future we may be able to implement tools like these for UI design automation, but from my point of view, that time is still far away, since this tool still has many limitations, especially considering the abstraction it has of a compared idea. to that of the human being. Although the final product has a certain quality, it still cannot be compared to the final products that a person with the necessary knowledge could produce.

It is important to mention that artificial intelligence is as intelligent as the person who programmed it or as intelligent as access to the database with which it works. Since as such artificial intelligence takes ideas from existing things and at least for the moment is not capable of generating its own ideas or innovating as a person could.
