

## UI Design Patterns

In the scholarship and student benefits website project, a relevant task would be to present the information in a clear and concise manner. Analyzing the article presented, it can be said that a good relevant UI design pattern is the "Progressive Disclosure".

This pattern consists of presenting the user with only the information needed at the moment and allowing them to access additional details if they wish. In our scholarship search interface, we apply this pattern by displaying only the basic information for each scholarship in a list and allowing the user to click on each one to access additional details such as requirements and application deadlines. Basically, we have the idea that the user can access the original page of the scholarship/benefit through a link.

In this way, we avoid overloading the user with too much information from the beginning and allow him to focus on what is relevant to him at the moment. This improves the usability of the interface and makes the search experience more efficient and effective for the user.

In short, it is a very effective UI design strategy to improve the user experience when searching for information about scholarships and benefits online.
