

As the objective of HCI is the usability of a product, it is a user experience factor that measures how easy it is to use and navigate a digital product. For this usability to be good, the handling must be intuitive, efficient, comfortable and safe.

Normally UX tries to make things useful and beautiful. HCI works on novel ideas that improve some aspect of usability, but does not focus on the aesthetic or operational behavior of graphical interfaces.

One feature we could implement in our project is simple navigation. That is, users should be able to navigate through our product in an intuitive way. A way to see this in a more direct way would be to create our prototype and see its structure.
