HCI & UX

The relation between HCI and UX it's strong because they both share the goal of improve the way that we interact with informatic systems. They are always trying to made the systems easier to use and have a better performance in overall.

If we have to remark the differences, HCI it's focused on improving how the users interact with both hardware and software, always finding the best way to do this. On the other hand, UX is concerned with the overall experience for a user when trying to interact with a system or product, including accessibility, integration with other systems or products and other aspects like aesthetics and interface design.

Taking this, if our project could be completed, I'd like to have not only the information of our possible benefits, but the direct links to access to the benefits (as long as it's possible) would be a very nice implementation.
