AITools

Although nowadays the AI has made gigantic steps to be more efficient, they can still fail, and don't forget, they are made by us, who fails. If we compare the efficiency between the code that for example, Chat GPT can generate versus the code that a Rookie programmer can generate, the difference it's big, even against advanced programmers, the fast way in this AI produce code is unbelievable. But if we talk about implement more features to that same code, the programmer still wins.

In my experience, using this tools could be very helpful to do the repetitive blocks of code, bot for implementing along with another tools doesn't work so nice as I'd like. One thing that I don't like from ChatGPT, is that when it doesn't know something, the AI doesn't tell you, and gives you wrong information with a big confidence that even you start to know it's the true.

Personally, I think that AI tools will stay with us as a big helpful way to make our job easier. And can be life enhancer by saving us time to do another tasks that are involved on the software development.
