HCI&UX

HCI and UX design are similar in many ways, HCI is considered to be a predecessor of UX design. The information that HCI professionals collect is used to constantly refine the world of UX design.

Both use significant amounts of user research, iterative testing, and information architecture (IA). Each of them aims to make interaction with computers of all kinds more accessible and intuitive.

Although they complement each other very well, the key differences are that HCI focuses on the interactions that a user has with the product and how it can be executed. UX designers care about the overall user journey that is made up of all those interactions.

We can well understand that it is always a good idea for a project to use both, since we are interested in a project or product being usable both in the long term and in the short term. I can't imagine a life where in order to use my computer for entertainment I have to I have to memorize the console commands, or even how grateful I am for smart technology that would not be possible without HCI and UX design.
